

June 19, 2026

Dear Castle Pines Village Resident,

We are required by Colorado state law to provide you with our annual Drinking Water Consumer Confidence Report (CCR). This year's report is attached to this letter. The CCR summarizes the water quality testing we conducted throughout 2025 and confirms what we already know: your drinking water is excellent.

All regulated contaminants were detected well below state and federal limits, and several were undetectable entirely. Our disinfection residuals were maintained at 100% compliance throughout the year. **By any objective measure, the water coming out of your tap is clean, safe, and of high quality.**

The report also discloses two violations from 2025 related to our backflow prevention and cross-connection control program. These violations were administrative in nature and did not affect water quality. One stemmed from a gap in our compliance ratio for annual backflow device testing, and the other involved a subset of backflow devices that had not been tested in more than two years. We also missed a public notification deadline related to the first violation, which is noted in the report as well. All three issues have been resolved, and we have implemented an updated cross-connection control program with clearer policies and enforcement tools to prevent recurrence.

We take pride in delivering water that consistently meets or exceeds state and federal standards, and we remain committed to the infrastructure investments and operational practices that make that possible. Your water is something you should feel good about.

If you have questions about the report or your water quality, please feel free to contact the District via email at info@CPVMetroCO.gov or via phone at (303) 688-8330.

Sincerely,

Castle Pines Village Metropolitan District

Castle Pines Village Metropolitan District

2026 Drinking Water

Consumer Confidence Report

For Calendar Year 2025

Public Water System ID # CO0118005

Esta es información importante. Si no la pueden leer, necesitan que alguien se la traduzca.

We are pleased to present to you this year's water quality report. Our constant goal is to provide you with a safe and dependable supply of drinking water.

General Information About Drinking Water

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (1-800-426-4791) or by visiting [epa.gov/ground-water-and-drinking-water](https://www.epa.gov/ground-water-and-drinking-water). Some people may be more vulnerable to contaminants in drinking water than the general population.

Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV-AIDS or other immune system disorders, some elderly, and infants can be particularly at risk of infections. These people should seek advice about drinking water from their health care providers. For more information about contaminants and potential health effects, or to receive a copy of the U.S. Environmental Protection Agency (EPA) and the U.S. Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and microbiological contaminants call the EPA Safe Drinking Water Hotline at (1-800-426-4791).

Contaminant Information

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- **Microbial contaminants:** viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants:** salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

- **Pesticides and herbicides:** may come from a variety of sources, such as agriculture, urban storm water runoff, and residential uses.
- **Radioactive contaminants:** can be naturally occurring or be the result of oil and gas production and mining activities.
- **Organic chemical contaminants:** including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and also may come from gas stations, urban storm water runoff, and septic systems.

In order to ensure that tap water is safe to drink, the Colorado Department of Public Health and Environment prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration regulations establish limits for contaminants in bottled water that must provide the same protection for public health.

Lead in Drinking Water

Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing. We are responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time.

You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly.

Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have a lead service line or galvanized requiring replacement service line, you may need to flush your pipes for a longer period. If you are concerned about lead in

your water and wish to have your water tested, contact Jason LeTellier at 303-688-8330. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at epa.gov/safewater/lead.

Service Line Inventory

New state and federal laws require us to inventory all water service lines in our service area to classify the material. A service line is the underground pipe that carries water from the water main, likely in the street, into your home or building. If you would like to view a copy of our service line inventory or have questions about the material of your service line, contact Jason LeTellier at 303-688-8330.

Our Water Source(s)

Source	Water Type	Potential Sources of Contamination
Well A10	Ground Water	Urban recreational grasses, fallow, deciduous forest, evergreen forest, septic systems, and road miles.
Well De10R	Ground Water	
Well Lda10R	Ground Water	
Well A8	Ground Water	
Well A4R	Ground Water	
Well A12	Ground Water	
Well De2	Ground Water	
Well Lda12	Ground Water	
Purchased From CO0118010	Surface Water – Consecutive Connection	

Source Water Assessment and Protection (SWAP)

The Colorado Department of Public Health and Environment has provided us with a Source Water Assessment Report for our water supply. You may obtain a copy of the report by visiting: wqcdcompliance.com/ccr the report is located under “Guidance: Source Water Assessment Reports”. Search the table using CO0118005, CASTLE PINES VILLAGE MD, or by contacting Jason LeTellier at 303-688-8330.

Potential sources of contamination in our source water area could come from urban recreational grasses, fallow, deciduous forest, evergreen forest, septic systems, and road miles.

The Source Water Assessment Report provides a screening-level evaluation of potential contamination that **could** occur. It does not mean that the contamination **has or will** occur. We can use this information to evaluate the need to improve our current water treatment capabilities and prepare for future contamination threats. This can help us ensure that quality finished water is delivered to your homes. In addition, the source water assessment results provide a starting point for developing a source water protection plan.

Please contact Jason LeTellier at 303-688-8330 to learn more about what you can do to help protect your drinking water sources, any questions about the Drinking Water Consumer Confidence Report, and to learn more about our system, or to attend scheduled public meetings. We want you, our valued customers, to be informed about the services we provide and the quality water we deliver to you every day.

General Water Characteristics

Castle Pines Village Metropolitan District frequently receives questions relating to the general characteristics of the water being provided. This table summarizes a few key characteristics of the water and offers a brief description. The range represented in this table is representative of the typical water conditions. For more information, please contact Jason LeTellier at 303-688-8330.

Parameter	Range	Unit of Measure	Description
pH	7.0 – 7.9	pH	pH is a measure of the acidic or basic properties of a liquid. It uses a scale of 0-14 with a pH of 7 considered neutral. Values less than 7 are acidic and values greater than 7 are basic. Water at Castle Pines Metro District can fluctuate slightly but remains very close to neutral.
Hardness	120 – 171	mg/L	Hardness in water is a measure of the calcium and magnesium content of the water. Higher hardness requires more soap to cause suds and can also leave deposits on glassware, sinks, and anything that is regularly in contact with water. Hardness does not have any impact on health. The hardness at Castle Pines Metro District is considered to be moderate.
	7 – 10	grains/gallon	
Chlorine	0.20 – 1.2	mg/L	Chlorine is added to drinking water to keep the water safe. It provides a disinfection barrier but is not harmful to health at the levels maintained by Castle Pines Metro District. Distance from the water plants is the primary factor in determining the amount of chlorine at a given location.
Iron	0 – 0.10	mg/L	Iron is removed at the water plants at Castle Pines Metro District for aesthetic reasons and is therefore usually not detectable. Water can sometimes increase in iron content as it moves through the distribution system but remains low. There are no health impacts of iron at these levels.

<u>Terms and Abbreviations</u>		
<u>Term</u>	<u>Abbreviation</u>	<u>Definition</u>
Maximum Contaminant Level Goal	MCLG	The 'Goal' is the level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.
Maximum Contaminant Level	MCL	The 'Maximum Allowed' is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
Below Detection Level	BDL	Sample results were below minimum detectable amounts
Treatment Technique	TT	A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.
Action Level	AL	The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
Maximum Residual Disinfectant Level Goal	MRDLG	The level of a drinking water disinfectant, below which there is no known or expected health risk. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
Maximum Residual Disinfectant Level	MRDL	The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Average of Individual Samples	No Abbreviation	The typical value. Mathematically it is the sum of values divided by the number of samples.
Range of Individual Samples	No Abbreviation	The lowest value to the highest value.
Number of Samples	No Abbreviation	The number or count of values.
Gross Alpha, Including RA, Excluding RN & U	No Abbreviation	This is the gross alpha particle activity compliance value. It includes radium-226 but excludes radon 222 and uranium.
Microscopic Particulate Analysis	MPA	An analysis of surface water organisms and indicators in water. This analysis can be used to determine performance of a surface water treatment plant or to determine the existence of surface water influence on a ground water well.
Variance and Exemptions	V/E	Department permission not to meet an MCL or a treatment technique under certain conditions.
Parts per million = Milligrams per liter	ppm = mg/L	One part per million corresponds to one minute in two years or a single penny in \$10,000.
Parts per billion = Micrograms per liter	ppb = ug/L	One part per billion corresponds to one minute in 2,000 years or a single penny in \$10,000,000.
Parts per trillion = Nanograms per liter	ppt = nanograms/L	One part per trillion corresponds to one minute in 2,000,000 years or a single penny in \$10,000,000,000.
Parts per quadrillion = Picograms per liter	ppq = picograms/L	One part per quadrillion corresponds to one minute in 2,000,000,000 years or one penny in \$10,000,000,000,000.
Picocuries per liter	pCi/L	Picocuries per liter is a measure of the radioactivity in water.
Nephelometric Turbidity Unit	NTU	Nephelometric turbidity unit is a measure of the clarity of the water. Turbidity in excess of 5 NTU is just noticeable to the average person.
Not Applicable	N/A	Not Applicable
Violation	No Abbreviation	A failure to meet a Colorado Primary Drinking Water Regulation.
Formal Enforcement Action	No Abbreviation	An escalated action taken by the State (due to the number and/or severity of violations) to bring a non-compliant water system back into compliance by a certain time, with an enforceable consequence if the schedule is not met.

Detected Contaminants

Castle Pines Village Metropolitan District routinely monitors for contaminants in your drinking water according to Federal and State laws. The following table(s) show all detections found in the period of January 1 to December 31, 2025, unless otherwise noted. The State of Colorado requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. Therefore, some of our data, though representative, maybe more than one year old. The “Range” column in the table(s) below will show a single value for those contaminants that were sampled only once. Violations, if any, are reported in the next section of this report.

Note: Only detected contaminants sampled within the last 5 years appear in this report. If no tables appear in this section, then no contaminants were detected in the last round of monitoring.

Disinfectants Sampled in the Distribution System Treatment Technique Requirement: At least 95% of samples per period (month or quarter) must be at least 0.2 ppm <u>OR</u> If the sample size is less than 40 samples no more than 1 sample is below 0.2 ppm Typical Sources: Water additive used to control microbes						
Contaminant Name	Time Period	Results	Number of Samples Below-Level	Sample Size	TT Violation	MRDL
Chlorine	December 2025	<u>Lowest period</u> percentage of samples meeting TT requirement: 100%	0	6	No	4.0 ppm

Lead and Copper Sampled in the Distribution System										
Analyte Name	Monitoring Period	Tap Sample Range Low-High	90th Percentile	Number of Samples	Unit of Measure	Action Level	Sample Sites Above Action Level	AL or TT Violation?	Typical Sources	Potential Health Effects from Long-Term Exposure Above the Action Level (unless specified as short-term)
COPPER	08-09-2024 to 09-18-2024	0.034 - 0.744	0.58	20	ppm	1.3	0	No	Corrosion of household plumbing systems; Erosion of natural deposits.	Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.
LEAD	08-09-2024 to 09-18-2024	0 – 8.0	2	20	ppb	15	0	No	Corrosion of household plumbing systems; Erosion of natural deposits.	Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development. Children could show slight deficits in attention span and learning abilities. Adults who drink this water over many years could develop kidney problems or high blood pressure.

Radionuclides Sampled at the Entry Point to the Distribution System										
Analyte Name	Year	Average of Individual Samples	Range of Individual Samples (Lowest – Highest)	Number of Samples	Unit of Measure	MCL	MCLG	MCL Violation?	Typical sources	Potential Health Effects from Long-Term Exposure Above the MCL (unless specified as short-term)
COMBINED RADIUM	2021	2.2	2.2 to 2.2	1	pCi/L	5	0	No	Erosion of natural deposits.	Some people who drink water containing radium -226 or -228 in excess of the MCL over many years may have an increased risk of getting cancer.
COMBINED URANIUM	2021	0.86	0.86 to 0.86	1	ppb	30	0	No	Erosion of natural deposits	Some people who drink water containing Uranium in excess of the MCL over many years may have an increased risk of cancer.
GROSS BETA PARTICLE ACTIVITY	2021	3.2	3.2 to 3.2	1	pCi/L*	50	0	No	Erosion of natural deposits.	Certain minerals are radioactive and may emit a form of radiation known as alpha radiation. Some people who drink water containing alpha in excess of the MCL over many years may have an increased risk of cancer.
*The MCL for Gross Beta Particle Activity is 4 mrem/year. Since there is no simple conversion between mrem/year and pCi/L EPA considers 50 pCi/L to be the level of concern for Gross Beta Particle Activity.										

Inorganic Contaminants Sampled at the Entry Point to the Distribution System										
Analyte Name	Year	Average of Individual Samples	Range of Individual Samples (Lowest - Highest)	Number of Samples	Unit of Measure	MCL	MCLG	MCL Violation?	Typical Sources	Potential Health Effects from Long-Term Exposure Above the MCL (unless specified as short-term)
BARIUM	2021	0.1	0.1 to 0.1	1	ppm	2	2	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.	Some people who drink water containing barium in excess of the MCL over many years could experience an increase in their blood pressure.
FLUORIDE	2021	0.8	0.8 to 0.8	1	ppm	4	4	No	Erosion of natural deposits; Water additive that promotes strong teeth; Discharge from fertilizer and aluminum factories.	Some people who drink water containing fluoride in excess of the MCL over many years could get bone disease, including pain and tenderness of the bones. Fluoride in drinking water at half the MCL or more may cause mottling of children's teeth, usually in children less than nine years old. Mottling, also known as dental fluorosis, may include brown staining and/or pitting of the teeth, and occurs only in developing teeth before they erupt from the gums.
NITRATE - NITRITE	2021	0.2	0.2 to 0.2	1	ppm	10	10	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.	Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue baby syndrome.

Disinfection By-Products Sampled in the Distribution System										
Disinfection Byproducts Sampled in the Distribution System	Year	Average of Individual Samples	Range of Individual Samples (Lowest - Highest)	Number of Samples	Unit of Measure	MCL	MCLG	MCL Violation?	Typical Sources	Potential Health Effects from Long-Term Exposure Above the MCL (unless specified as short-term)
Total Haloacetic Acids (HAA5)	2024	1.7	1.7 to 1.7	1	ppb	60	N/A	No	Byproduct of drinking water disinfection	Some people who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.
Total Trihalomethanes (TTHM)	2025	3.27	3.27 to 3.27	1	ppb	80	N/A	No	Byproduct of drinking water disinfection	

Synthetic Organic Contaminants Sampled at the Entry Point to the Distribution System										
Contaminant Name	Year	Average of Individual Samples	Range of Individual Samples (Lowest – Highest)	Number of Samples	Unit of Measure	MCL	MCLG	MCL Violation?	Typical sources	Potential Health Effects from Long-Term Exposure Above the MCL (unless specified as short-term)
Di (2 – ethylhexyl) phthalate	2024	1.55	0.0 to 6.2	4	ppb	6	0	No	Discharge from rubber and chemical factories	DEHP is also a possible cancer causing agent in humans, although human studies remain inconclusive, due to the exposure of multiple elements and limited research.

Unregulated Contaminants										
EPA has implemented the Unregulated Contaminant Monitoring Rule (UCMR) to collect data for contaminants that are suspected to be present in drinking water and do not have health-based standards set under the Safe Drinking Water Act. EPA uses the results of UCMR monitoring to learn about the occurrence of unregulated contaminants in drinking water and to decide whether or not these contaminants will be regulated in the future. We performed monitoring and reported the analytical results of the monitoring to EPA in accordance with its Third Unregulated Contaminant Monitoring Rule (UCMR3). Once EPA reviews the submitted results, the results are made available in the EPA’s National Contaminant Occurrence Database (NCOD) (http://www.epa.gov/dwucmr/national-contaminant-occurrence-database-ncod) Consumers can review UCMR results by accessing the NCOD.										
More information about the contaminants that were included in UCMR monitoring can be found at: drinktap.org/Water-Info/Whats-in-My-Water/Unregulated-Contaminant-Monitoring-Rule-UCMR. Learn more about the EPA UCMR at: epa.gov/dwucmr/learn-about-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at (800) 426-4791 or epa.gov/ground-water-and-drinking-water.										

Secondary Contaminants(SC)/ Other Monitoring(OM)	Year	Average	Range	Sample Size	Unit	Secondary Standards/ MCL
SODIUM	2021	17.8	17.8 to 17.8	1	ppm	N/A
Secondary standards are non-enforceable guidelines for contaminants that may cause cosmetic effects (such as skin, or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water						

Violations

Health-Based Violations

The District failed to complete an action that could affect water quality. Please read the information shown below about potential health effects for vulnerable populations. These are the same violations that we told you about in past notices. We were required to meet a minimum operation/treatment standard, we were required to make upgrades to our system, or we were required to evaluate our system for potential sanitary defects, and we failed to do so in the time period shown below.

The District had an inadequate backflow prevention and cross-connection control program. Uncontrolled cross connections can lead to inadvertent contamination of drinking water. We also installed or permitted an uncontrolled cross connection. Both issues were resolved as outlined in the table below.

Additional violation information: Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

Name	Description	Time Period	Health Effects	Compliance Value	TT Level or MCL	Describe the steps taken to resolve and the anticipated resolution date:
CROSS CONNECTION RULE	FAILURE TO MEET CROSS CONNECTION CONTROL AND/OR BACKFLOW PREVENTION REQUIREMENTS - M619	06/23/2025 - 11/21/2025	Uncontrolled cross connections can lead to a back pressure or siphonage event that may allow contaminants or disease-causing organisms to enter the drinking water, which can cause diarrhea, nausea, cramps, and associated headaches.	N/A	N/A	Implemented updated cross connection control plan and adopted new fine and water shutoff policies. Resolved November 21, 2025.
CROSS CONNECTION RULE	FAILURE TO MEET CROSS CONNECTION CONTROL AND/OR BACKFLOW PREVENTION REQUIREMENTS - M611	06/23/2025 - 01/19/2026	Uncontrolled cross connections can lead to a back pressure or siphonage event that may allow contaminants or disease-causing organisms to enter the drinking water, which can cause diarrhea, nausea, cramps, and associated headaches.	N/A	N/A	Implemented updated cross connection control plan and adopted new fine and water shutoff policies. Resolved January 19, 2026

Non-Health-Based Violations

These violations do not usually mean that there was a problem with the water quality. If there had been, the District would have notified you immediately. The District missed collecting a sample (water quality is unknown), we reported the sample result after the due date, or we did not complete a report/notice by the required date. Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

Name	Description	Time Period	Describe the steps taken to resolve and the anticipated resolution date:
PUBLIC NOTICE	FAILURE TO NOTIFY THE PUBLIC/CONSUMERS	10/24/2025 – 6/30/2026	Paperwork to resolve the M619 cross connection violation was submitted prior to the deadline but required further revisions, which resulted in the public notice deadline being missed. Final public notice of this is being included with this report to satisfy this requirement.

IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

Castle Pines Village Metropolitan District

Self-reported the following violation of the Backflow Prevention and Cross Connection Control Rule

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

Our water system recently violated a drinking water requirement. Although this situation is not an emergency, as our customers you have a right to know what happened, what you should do, and what we did to correct this situation.

The state drinking water program requires that all public drinking water systems maintain compliance with the Backflow Prevention and Cross-Connection Control Rule. This includes testing a percentage of the backflow prevention devices annually and controlling potential cross-connections to the potable water system. The following violations of the Backflow Prevention and Cross-Connection Control Rule have been identified:

Identified Violation	Required Language	Violation Identified	Steps We Have Taken
M619 - Backflow Prevention Annual Compliance Ratio	Uncontrolled cross connections can lead to a back pressure or siphonage event that may allow contaminants or disease-causing organisms to enter the drinking water, which can cause diarrhea, nausea, cramps, and associated headaches.	June 23, 2025	The District has implemented a new Cross Connection and Control Program with fines and service disconnect policies for non-compliance.

We failed to notify you of the violation/situation in a timely manner.

Paperwork to resolve the M619 Cross Connection Violation was submitted prior to the deadline but required further revisions, which resulted in a public notice deadline of October 23rd, 2025 being missed. We failed to notify you of the violation/situation in a timely manner.

What does this mean? What should I do?

- There is nothing you need to do at this time. If a situation arises where the water is no longer safe to drink, you will be notified within 24 hours.

This violation was considered resolved by CDPHE on **November 21, 2025**. We are required to provide a final notice in order to meet public notification requirements for this violation. For more information, please contact **Jason LeTellier** at jletellier@cpvmetroco.gov or **303-688-8330.**, or **5880 Country Club Drive, Castle Rock, CO 80108.**

Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

This notice is being sent to you by: Castle Pines Village Metropolitan District - CO0118005
Date distributed: **June 30, 2026**
